

## Figure S5. The pan-caspase inhibitor zVAD inhibits Wogonin-induced apoptosis but not Wogoninmediated inhibition of RNAPII phosphorylation and McI-1 expression.

A. CEM cells were treated with 50  $\mu$ M Wogonin in the absence or the presence of 50  $\mu$ M zVAD-FMK (preincubated for 0.5 h). The effects of Wogonin on phosphorylation of RNAPII and Mcl-1 expression were analyzed by Western blot after 3 and 6 h treatment. B. Apoptotic cell death was determined by DNA fragmentation 24 h after Wogonin treatment. Means ± SD are shown.
