**Supplemental Data**

**Whole-Exome-Sequencing Identifies Mutations  
in Histone Acetyltransferase Gene *KAT6B* in Individuals  
with the Say-Barber-Biesecker Variant of Ohdo Syndrome**

Jill Clayton-Smith, James O'Sullivan, Sarah Daly, Sanjeev Bhaskar, Ruth Day, Beverley Anderson, Anne K. Voss, Tim Thomas, Leslie G. Biesecker, Philip Smith, Alan Fryer, Kate E. Chandler, Bronwyn Kerr, May Tassabehji, Sally-Ann Lynch, Małgorzata Krajewska-Walasek, Shane McKee, Janine Smith, Elizabeth Sweeney, Sahar Mansour, Shehla Mohammed, Dian Donnai, and Graeme Black

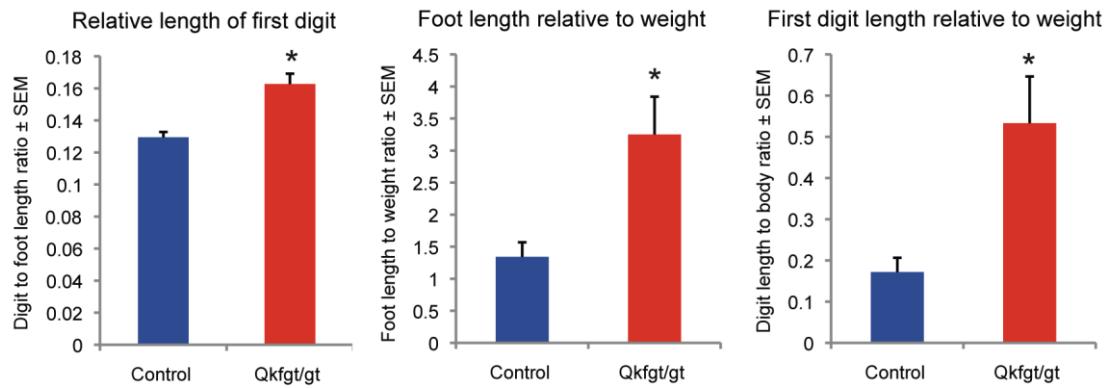

**Figure S1. Microarray Results of Individuals 3 and 17**

(A) Individual 3 was shown to have a duplication of ~2Mb within the long arm of chromosome 1 at band q21.1, flanked by markers CN\_436418 and CN\_004940 (nucleotides chr1:144643813-146814404 based on Ensembl Build 36) This duplication was subsequently confirmed using BAC probe RP11-533N14 , with parental FISH studies showing a normal hybridisation pattern.

(B) Deletion of ~8.3Mb from band p36.12 to p36.21, flanked by markers CN\_450710 and CN\_483670 (nucleotides chr1: 13339380-21692325 based on Ensembl Build 36) identified in Individual 17

(C) Duplication of ~1.3Mb within band 1p34 in Individual 17, flanked by markers CN\_488937 and CN\_022530 (nucleotides chr1: 34572912-35949096) Both changes were confirmed by fluorescent in-situ hybridisation (FISH) using the BAC probes RP11-174G17 and RP11-244H3 respectively.

**Figure S2. Demonstration of Disproportionately Long First Digits of Hind Limbs of *Qkfgt/gt* Mouse Compared to Wild-Type**

Images were taken of hindfeet of mice and measurements were taken from these images. Data were presented as means  $\pm$  SEM of biological replicates, i.e. measurements taken from individual mice ( $n = 3-4$  *Qkfgt/gt* and 3-4 controls), and analysed by two-sided T-test using Stata Intercooled 10.0 software

**Table S1. Clinical Features of All Individuals Tested**
