

Supplementary Fig. S3. Effects of CRP on the P_{nanE} activity *in vitro*. Supercoiled plasmid pBS0921 containing the P_{nanE} was used as a template DNA and transcribed *in vitro* in the presence of the enhancing concentrations of CRP with 1mM cAMP. Details for preparation of the supercoiled template DNA and *in vitro* transcription are given in Materials and Methods. The 370 base P_{nanE} specific transcripts and vector derived control transcripts RNA-1 are indicated.
