Figure 1 (supplement). Western blot shows that treatment with Angiotensin II (AngII) type 1 receptor blocker, Losartan (500mg/L in drinking water x 6 weeks) reduces the level of the phospho (Tyr416)-Src protein to 60% compared to untreated ACE8/8 mice supporting that the observed change in the phospho (Tyr416) Src is because of the elevated AngII level via its effect on AngII type 1 receptor.
