

Supplementary Figure 1. Isotype controls for intracellular staining for IFN- γ , IL-17, TGF- β , in gated CD25⁺ CD4⁺ T cells from the spleens of EAU-recovered wild type mice. The spleen cells from EAU-recovered wild type mice were collected, and restimulated with IRBpp 1-20 in culture for 24 hours as described in the methods. The cells were collected and stained as described in the methods for flow cytometry using isotype antibodies.
