Glyma20g01470	GmPAP34				++++		
Glyma20g03260	GmPAP35						

The fold-change of the expression of the *GmPAP* genes were calculated, and the expressions were then classified into four groups according to their tissue specificity, denoted as follows: +, preferentially (≥ 2 - and < 5 -fold changes between the expression levels of the most highly expressed and second most highly expressed genes); ++, specifically (≥ 5 - and < 10 -fold changes); +++, very specifically (≥ 10 - and < 25 -fold changes); and +++, exclusively identified in one tissue (≥ 25 -fold change) (Libault *et al.*, 2010. *The Plant Journal* **63**: 86–99).

TABLE S4. Quantitative real-time PCR analysis of expression levels of the *GmPAP* genes in different soybean tissues under different P treatments. Relative expression values are given.
