

### Spearman's rank correlation coefficient analysis

To determine whether there are differences between the microarray data received from T3 and GC-1 treatments, we used the Spearman's rank order correlation coefficient,  $r_s$ .

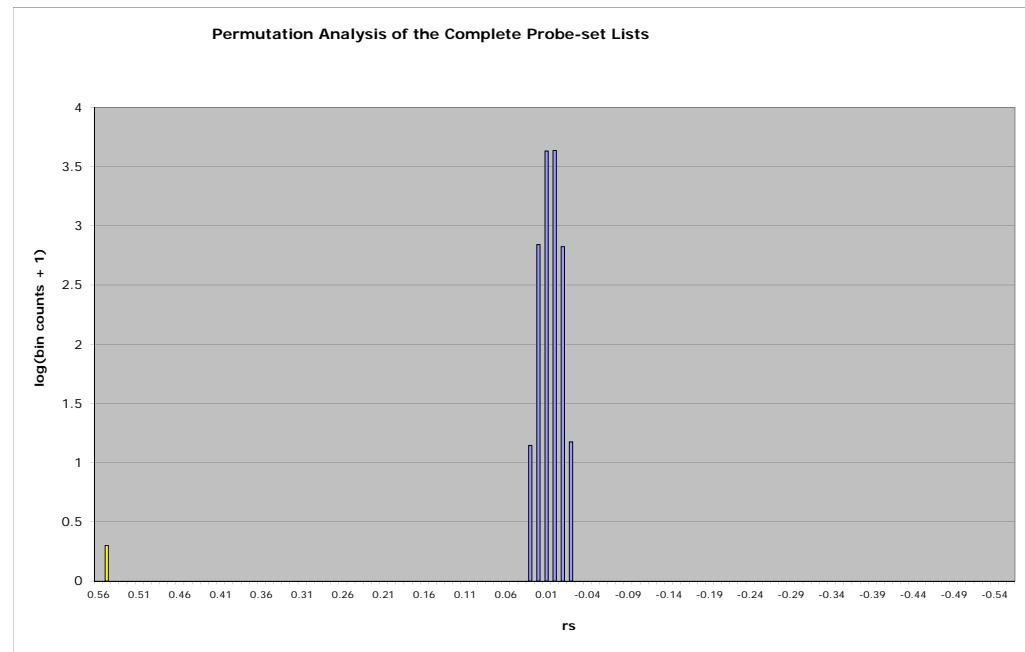

$$r_s = 1 - \frac{6\sum d_i^2}{n(n^2 - 1)}$$

where  $d$  is the difference between the probe-set rank in one dataset (T3) and that of the other (GC-1), and  $n$  is the number of probe-sets being compared. We decided to conduct the analysis with Affymetrix probe-set identifications instead of aggregating probe-sets into unified identifiers (e.g., Unigene) to eliminate the impact of splice variants.

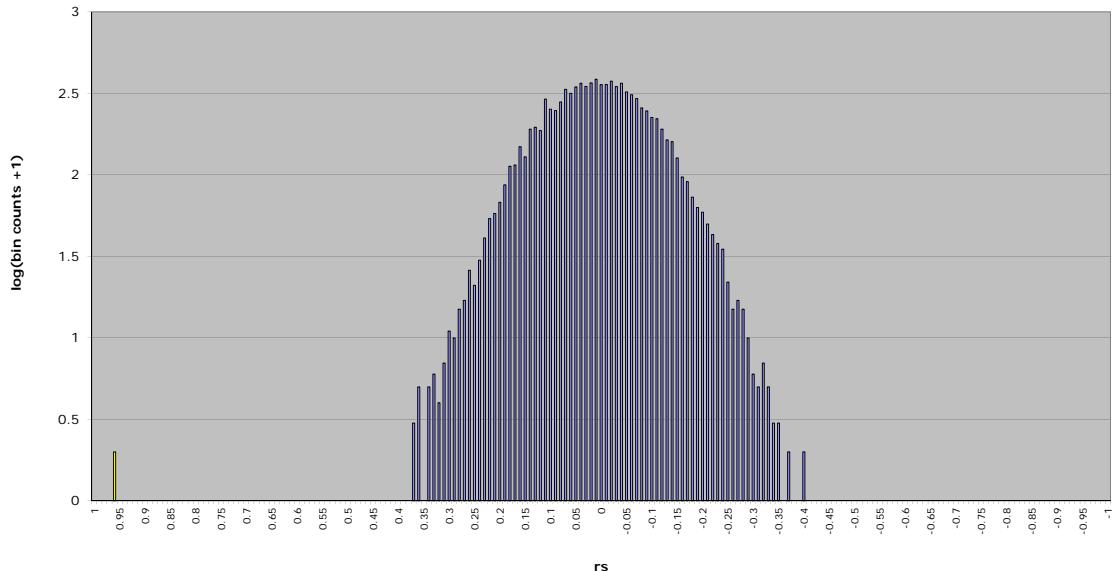

Affymetrix probe-sets for both datasets were ordered based upon fold induction of ligand-treated verses vehicle. We analyzed both the entire Affymetrix probe-set list ("complete probe-set list"), and probe-sets receiving an adjusted p-value  $\leq 0.05$  in both datasets ("significant probe-sets").

To determine if the calculated correlation coefficient,  $r_s$ , is greater than would be expected by chance, we performed empirical permutation analysis, where the rank-ordering of the genes in one list is randomly shuffled, followed by  $r_s$  calculation. The permutation analysis was done 10,000 times using a custom Python script. The p-value is simply the proportion of times that the  $r_s$  value in the shuffled list is greater than or equal to the correlation coefficient calculated for the experimental dataset.

In no instance were the shuffled lists  $r_s$  greater or equal to that received for either any experimental datasets ([HepG2 dataset example see](#) Figures below).

### Permutation Analysis of the Significant Probe-set Lists

**Fig. S1.** Verification of hypothyroid status of mice. Induction of hypothyroidism was confirmed by decreased total thyroxine ( $T_4$ ) levels in blood serum, bar graph represents  $T_4$  levels in different conditions. The slight increase in reactivity in animals after  $T_3$  gavage represents cross-reactivity with  $T_3$ .

**Fig. S2.** HepG2 cells express TR transcripts. The figure shows RT-PCR results with  $Tr\beta 1$  and  $TR\alpha 1$  primers relative to GAPDH. There is a slight increase in  $Tr\beta 1$  expression after ligand treatment, but this did not reach statistical significance.

**Fig. S3.** Q-PCR analysis confirms that predicted  $T_3$ -inducible genes are not upregulated in liver of  $T3$  or GC-1 treated mice (A) or HepG2 cells (B) in conditions of our experiments.

**Fig. S4.** Ligand dose responses with standard TRE-driven reporter gene in HepG2 cells transfected with  $TR\beta$  or  $TR\alpha$ . There is a significant rightward shift in GC-1 dose response obtained with GC-1 in the presence of  $TR\alpha$ .

Table S1.

PCR primers for mouse liver Q-PCR.

Symbol	Gene Name	TaqMan Assay ID
ANGPTL4	angiopoietin-like-4	Mm00480431_m1
CPT1a	carnitine palmitoyltransferase 1a, liver	Mm00550438_m1
DIO1	deiodinase, iodothyronine, type I	Mm00839358_m1
G6PC	glucose-6-phosphatase, catalytic	Mm00839363_m1
GPD2	glycerol phosphate dehydrogenase 2, mitochondrial	Mm00439082_m1
IDH3a	isocitrate dehydrogenase 3 (NAD <sup>+</sup> ) alpha	Mm00499674_m1
MCAD	acyl-Coenzyme A dehydrogenase, medium chain	Mm00431611_m1
ME1	malic enzyme 1, NADP(+)-dependent, cytosolic	Mm00782380_s1
PCK1	phosphoenolpyruvate carboxykinase 1, cytosolic	Mm01247058_m1
SREBP1c	sterol regulatory element binding transcription factor 1	Mm01138344_m1
THRSP	thyroid hormone responsive	Mm01273967_m1

## Sequences of primers for HepG2 QPCR\*
