

Supplemental Figure 4. Trilineage teratoma assay of iPSCe2-LVc4. Serial histological sections of a teratoma produced by iPSCe2-LVc4 cells stained with hematoxylin and eosin (H&E) or DAPI plus antibodies against MAP-2 (microtubule associated protein-2) for ectoderm, AFP (α -fetoprotein) for endoderm, and SMA (α -smooth muscle actin) for mesoderm. Bar = 50 microns.
