## Supplemental Figures

**Supplementary Figure 1. Restoration of the wild-type *in vitro* mutation frequency through chromosomal complementation of  $\Delta dinB$ .** Mutation frequencies for *wt*,  $\Delta dinB$ , and complemented strains under *in vitro* growth conditions. The *wt dinB* gene was restored in UTI89  $\Delta dinB$  via P1 transduction of the *wt* locus from UTI89 into its original location on chromosome, resulting in *dinB*<sup>+</sup> (complemented). Means are shown based on 8 independent cultures. Error bars show standard error (SE).

**Supplementary Figure 2. Pol IV enhances survival of UPEC CFT073 strain during UTI.** Female C3H/HeN mice were infected with CFT073 or the isogenic mutant  $\Delta dinB$  by transurethral inoculation. Bacterial CFU/Bladder  $\times 10^4$  at 48 hpi.

**Supplementary Figure 3. A Pol IV mutant has a fitness defect in C57BL/6 mice.**

*Panel A:* Enumeration of bacteria in the bladder after 48 hpi (CFU/Bladder  $\times 10^4$ ) for

UTI89 (showed as circles) and UTI89 *dinB* (showed as triangles) strains. *Panel B:*

mutation frequency per  $10^8$  cells measured for 6-aza<sup>r</sup> in bacteria collected after 48 hpi.
