

Supplemental Figure S1. PPI scores and mean VOI peak activation by FRA task variant.

Total PPI scores did not differ as a function of FRA task variant (part A) (ANOVA $P = .69$). In both right and left nucleus accumbens (NAcc) VOI, mean peak modeled BOLD signal change also did not significantly differ (ANOVA $P > .10$) by task version for any response trial type (Part B). In the mesofrontal cortex (mFC) VOI, mean peak modeled BOLD signal change did not significantly differ (ANOVA $P > .10$) by task variant for any nonresponse trial type (Part C).
