

Figure S1. Comparison of genotypic performance in mixture versus monoculture over time. Dandelion genotype mixture (plot genotypic richness > 1) versus monoculture (plot genotypic richness =1) means \pm 1 SE for leaf area (cm^2) at each of six measurement dates (N = 1800). Means are shown separately for (A) the fallow field and (B) the mowed lawn. Leaf area measurements were log-transformed before the genotypic means were calculated. The dashed line indicates a 1:1 relationship. Numbers refer to specific genotypes.
