

Online Supplemental Material

Longitudinal trends in diet and effects of sex, race, and education on dietary quality score change: the Coronary Artery Risk Development in Young Adults study.

Femke PC Sijtsma, Katie A Meyer, Lyn M Steffen, James M Shikany, Linda van Horn, Lisa Harnack, Daan Kromhout, David R Jacobs, Jr

Details about the investigator ratings of food groups and the CARDIA *a priori* diet score assignment derived from the investigator ratings are in **Supplemental table 1**. Between studies there exist food grouping differences, and few differences in ratings; generally the investigator opinion agreed very closely.

Black participants and those with less educational attainment generally showed more change than whites and more highly educated participants, but this pattern varied across food groups. Those demographic interactions which reached the Bonferroni corrected p-value of <0.0012 are indicated in **Supplemental table 2** we considered race and sex differences and education differences, but not race, sex, and education differences.

Differences among demographic groups, **Supplemental table 3** (by race and sex) and **4** (by education), were especially prominent and significant for the negative rated food groups. For most food groups changes were in the same direction for both demographic groups however one demographic group showed a larger increase or decrease compared to the other demographic groups.

Supplemental Table 1
Investigator ratings of food groups and comparability to previous studies.
