

SUPPLEMENTARY FIGURE LEGENDS

Figure S1. Lithium Chloride enhances EMT markers in cultured AECT cells.

AECTs expressing wt and mutant β -catenins were treated with Adeno-Cre and seeded on Fn. Cells were starved and treated without or with LiCl (20 mM) for 3 days and then EMT markers analyzed by immunoblotting as described in the main text. LiCl enhanced TGF β 1-induced Twist1, α -SMA, and col I in the presence of wt or Y654E- β -catenin, but not in the absence of β -catenin nor replacement by Y654F mutant.
