

### Supplemental Figure 1

Cos-7 cells were transfected with the indicated plasmids, together with CMX- $\beta$ -galactosidase transfection control and MH100x4-tk-luc reporter. Transfected cells were treated with 0.1% DMSO (solvent control) or the indicated concentrations of the potent and selective RXR agonist AGN195203. Data are expressed as relative light units (normalized to  $\beta$ -galactosidase)  $\pm$  S.E.M. and represent the average of triplicates  $\pm$  S.E.M.
