Full details of Study Participant Characteristics. Socioeconomic status (SES) was quantified using Hollingshead scales(Hollingshead, 1975). Participants were of mixed handedness (handedness established using Physical and Neurological Examination of Soft Signs).

Test-statistics, Stereotactic Coordinates corresponding Brodmann Areas labels for Cortical Regions Shown in Figures 1, 2 and 3, and. The co-ordinates are given in MNI space for the maximum vertex within each contiguous cortical region where statistically significant effects were found. Corresponding Brodmann areas (BA) were determined by converting to Talairach co-ordinates. Talairach Daemon and visual inspection of the Talairach atlas were used to assign BA label to each vertex of interest.
