

Figure S4 (A-E): QQ plots of individual studies for mean platelet volume (MPV)

Blue dots are SNPs plotted on the x-axis of expected p-value under the null hypothesis against observed p-value in the study (p-values are plotted here as negative logarithm 10). Red diagonal line represents the line of unity, the region where expected and observed p-values are the same. Black lines above and below the red diagonal line bound 95% confidence intervals
