

## The complete cDNA sequence of mouse elongation factor 1 alpha (EF 1 alpha) mRNA

Xiang Lu and Dieter Werner

Institut für Zell- und Tumorbiologie, Deutsches Krebsforschungszentrum, Im Neuenheimer Feld 280, D-6900 Heidelberg, FRG  
Submitted December 5, 1988

Accession no. X13661

The elongation factor 1 alpha (EF 1 alpha) catalyses the binding of aminoacyl-tRNA to the ribosome under hydrolysis of GTP. cDNA clones exist for EF 1 alpha from *S. cerevisiae* (1); *Artemia* (2) and human (3). Partial N-terminal nt sequences of EF 1 alpha from mouse were presented elsewhere (4, 5). By differential hybridisation of cell cycle phase-specific cDNA libraries (6) we identified an S-phase-specific clone comprising the cDNA sequence for full length mouse elongation factor 1 alpha mRNA:

```

The ORF starts from position 40 which is preceded by the stop codon at position 25-27. The termination codon is assigned to TGA at 1423-1425. Thus, the mouse EF 1 alpha mRNA encodes a protein of 461 amino acids with a predicted mol. wt. of 50466 d. The cDNA sequence presented here contains a 15 nt poly(A) tract preceded by ATTAAA from 1685 - 1690. Within the ORF, the mouse EF 1 alpha is highly homologous to the human EF 1 alpha (98.1% homology at the aa level, 91.8% at the nt level). Differences in the nt sequence, preferentially at the 'wobble' position, and in the aa sequence, are underlined. Between nt 753 and 754 the human EF 1 alpha contains an additional codon ACT for a threonine.
