

Supplementary Figure S2

Supplementary FIG. S2. YY1 conditional knock-down reduces the number of CD138 positive cells. Cells cultured in 5 $\mu\text{g/ml}$ LPS and 20 ng/ml IL4 for 3 days were stained with anti-CD138-APC as well as anti-IgG1-PE. The panel at the right shows summary data from six independent experiments. Error bars show standard deviation of the mean and the double asterisks represents $p < 0.001$.
