Supplemental Figure Legends

Supplemental Figure 1. *In vivo* kinetics of CXCR4^{dim}CD5^{bright}, CXCR4^{int}CD5^{int} and CXCR4^{bright}CD5^{dim} fractions of each CLL patient's clone. Curves represent the fraction of labeled cells at the 2 time points studied (Figure 1E). Patients are displayed in numerical order. Note that a wide range of fraction of labeled cells (y axes) was observed among patients; for this reason, graphs have different scales. X axis represents time in days. Vertical dotted lines illustrate the end of ²H₂O consumption and vary based on the ²H₂O protocol followed by the patient. Note that for CLL 546 and CLL 606 we have only one time point measurement, a 1st and 2nd time point, respectively. In CLL 875, only CXCR4^{dim}CD5^{br} and CXCR4^{int}CD5^{int} fractions could be obtained. The box at the bottom indicates the calculated maximum fraction of labeled cells observed for each patient.

Supplemental Figure 2. *Real-time quantitative PCR analyses of selected genes differentially expressed in proliferative and resting fractions.* Plot shows the ratio of log transformed qRT-PCR values for genes in the two fractions. Black bars: genes higher in proliferative fraction; white bars: genes higher in resting fraction. ° $P < 0.05$, * $P < 0.01$, ** $P < 0.001$

Methodology. Total RNA from the sorted CXCR4/CD5 fractions was isolated by RNeasy Mini kit (Qiagen) and first-strand cDNA synthesis made using High-capacity cDNA Reverse Transcription Kit (Applied Biosystems, Carlsbad, CA). RT-PCR was performed with TaqMan Low-Density Array microfluidics cards (Applied Biosystems) and an ABI Prism 7900 HT Sequence Detection System (Applied Biosystems) with cycling for 2 min at 50°C and 10 min at 95°C, followed by 40 cycles of 30s at 97°C and 1 min at 59.7°C. GAPDH and HPRT1 housekeeping genes served as endogenous controls for normalization. MicroFluidicCards were analyzed with RQ documents and the RQ Manager Software (comparative CT method).
