

**A****B****C**

**Supplemental Figure 1.** Identification of in vitro Ume6p acetylation sites. **(A)** Reactions as described in Figure 1A were examined by a Bruker Reflex IV MALDI-TOF mass spectrometer following separation by a Waters 2690 HPLC system. Three representative spectra from acetylated and control samples are depicted. The corresponding peptide sequences with (K') and without (K) acetylation are indicated. **(B)** An in vitro acetylated Gst-Ume6 reaction with increasing amount of extract (2 or 4  $\mu$ l) as described in Materials and methods was split into thirds and separated by PAGE. The gels were blotted and probed with either the  $\alpha$ K736-Ac or  $\alpha$ K745-Ac antibodies. No HAT extract control ( $\emptyset$ ) was also included. **(C)** Wild type strain expressing T7-Ume6p was grown to mid-log phase in acetate medium (0 hr) then transferred to sporulation medium (SPM) for 3 or 6 hrs. Extracts prepared from these samples were immunoprecipitated with T7 Mab and the immunoprecipitates blotted and probed with either the T7 Mab,  $\alpha$ K736-Ac or  $\alpha$ K745-Ac.
