

Figure S5

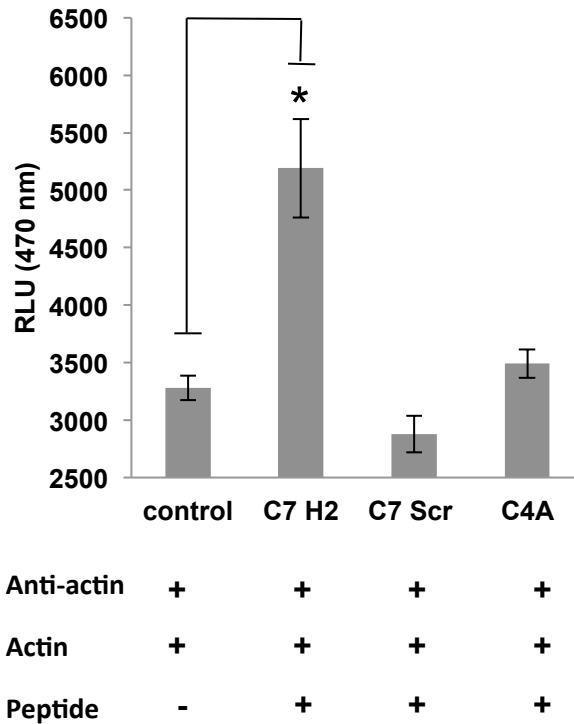

FIGURE S5. Binding of C4A peptide to β -actin and actin polymerization. ELISA plates were coated with bovine serum albumin with or without peptides: C7H2, C4A or scramble peptide Scr-C7H2, all at 500 $\mu\text{g/ml}$. β -actin was added and then anti-actin antibody and the secondary anti-antibody. A clear binding of β -actin to C7H2 is observed, $p < 0.01$. Binding of C4A to β -actin was very poor, $p = 0.082$ in relation to the control.
