

Fig. S4

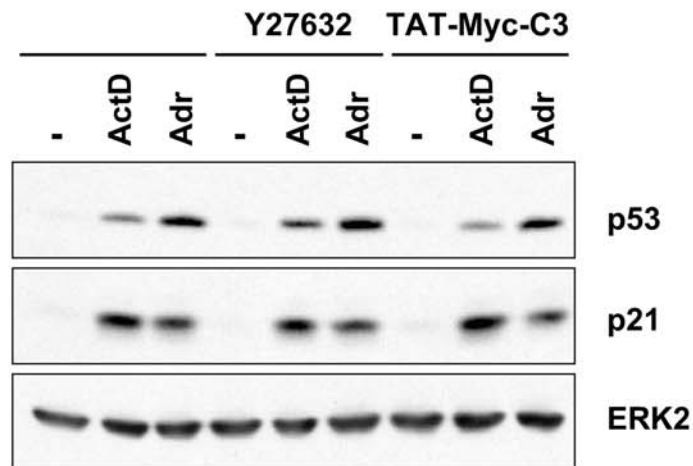

Figure S4 Rho or ROCK inhibition do not affect p53 activation. MCF-7 cells were treated with ActD (2 nM) or Adr (0.2 μ g/ml) in the presence or absence of Y-27632 (10 μ M) or Tat-C3 (80 μ g/ml) for 24 hours. Whole cell lysates were immunoblotted with antibodies against p53 and p21. ERK2 immunoblotting revealed equivalent protein loading.
