

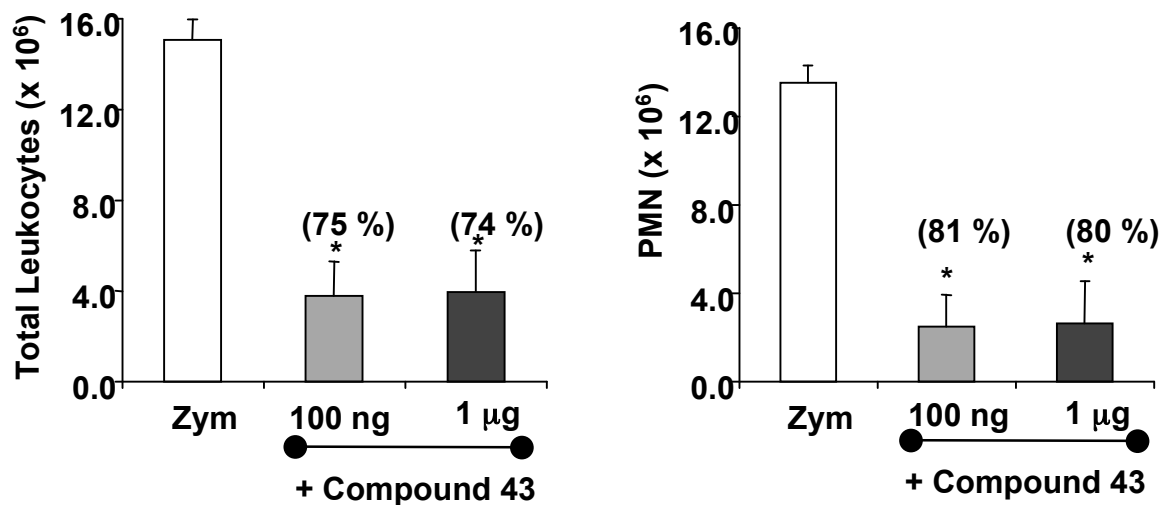

Fig S2

Supplemental Figure 2. Compound 43 regulates leukocyte trafficking in murine peritonitis. Mice were injected i.v. with Compound 43 followed by i.p. injection of 1 mg zymosan. Exudates were collected 4 h post injection and total cells enumerated using a hemocytometer. PMN numbers were determined by Ly-6G staining using flow cytometry. Results are mean \pm SEM, * $p < 0.05$ ($n = 4$) compared to zymosan alone.
