

Figure S2. Calphostin C does not affect BREC viability. BREC were cultured as described in Methods. Cells death was determined by the LDH cytotoxicity assay (CytoTox 96 Assay, Promega). **(A)** Representative phase contrast microphotographs of confluent BREC monolayers after 4 days exposure to either HG or HG+calphostin C (CalC). **(B)** Bar plot of LDH release. Values are mean \pm SD of the data obtained in three different isolates.
