

## **Supplemental Material:**

### **Supplemental Methods**

**Protein and Lipid Oxidation:** Protein carbonyl formation was measured using the Oxyblot system (Millipore) according to the manufacturer's instructions and as described previously <sup>(1)</sup>. Malondialdehyde (MDA) content indicative of lipid peroxidation was measured using a Bioxytech MDA-586 kit (OxisResearch, Burlingame, Ca) according to the manufacturer's instructions and as described previously <sup>(1)</sup>.

### **Supplemental Figure Legends**

#### **Figure Legends:**

**Supplemental Figure 1 – Cold crystalloid cardioplegia reduces cardiac performance.** A) Representative experiment of cardioplegia/reperfusion in isolated rat hearts. a. – baseline measurement b. – induction of cardioplegia (2 min delivery) , c) Cardioplegic arrest 30 min (1 min CP delivery) d 60 min Cardioplegic arrest (1 min CP) e. 90 min CP (1 min delivery) f. Start reperfusion. g-h: 5, 10, 20 ,30 min reperfusion. **B)** Tracings from individual hearts subjected to CP and reperfusion with or without 1 uM Rottlerin.

**Supplemental Figure 2. Rottlerin does not alter wet/dry tissue weight.** None of the treatments significantly effected wet/dry tissue weights indicating no gross increases in tissue edema. Minimum n=6, except CP + Rott + Paxilline 1 uM , n=4. One Way Anova,.

**Supplemental Figure 3. The BK<sub>Ca++</sub> channel inhibitor paxilline blocks beneficial effects of rottlerin on post-CP cardiac function.** Experimental conditions similar to figures 1 and 2. Cotreatment with rottlerin (1 uM) and Paxilline (100 nM or 1 uM) supplied as an additive to cardioplegia. **A)** Developed Pressure, **B)** +dP/dt, **C)** -dP/dt, **D)** Tau, and **E)** LVEDP **F)** Heart rate and **G)** Coronary Flow. X-axis time : Baseline – pre CP

function, CP – Cardioplegia, 5 - 30 – min reperfusion. n = minimum of 6 per group, except Rottlerin + 1 uM Pax, n=4. One Way ANOVA, Student Newman-Keuls.

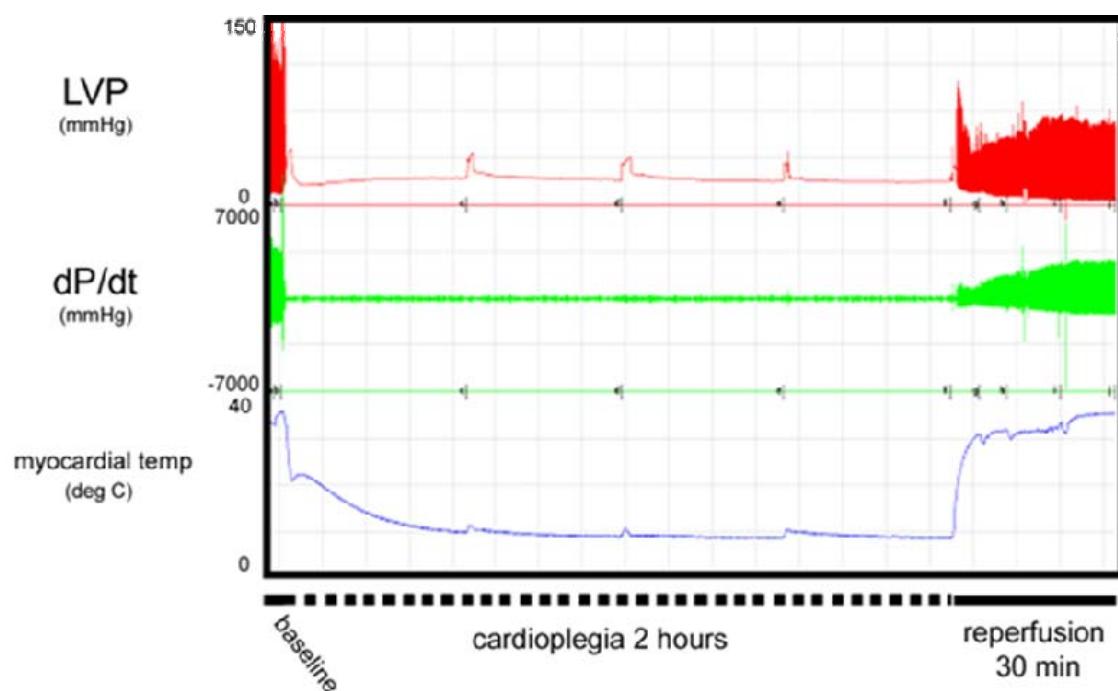

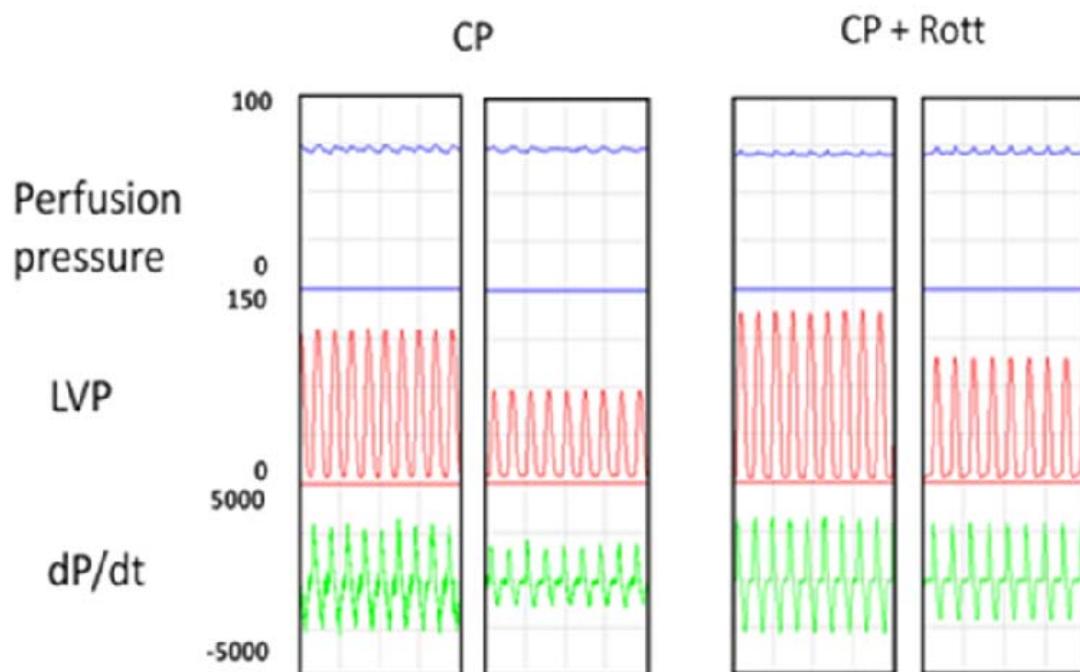

**Supplemental Figure 4– Rottlerin does not significantly alter protein or lipid oxidation.** A Representative oxyblot and graph of normalized fold increase over sham in protein carbonyl content measured by oxyblot. B) Graph of lipid oxidation measured by tissue MDA content. Graphs minimum n=6 / group. One Way ANOVA,.

**Supplemental Figure 5– Rottlerin does not significantly alter phospholamban or troponin I phosphorylation.** Graph displays normalized fold increase in phosphorylation over sham. Minimum n=6 / group. One Way ANOVA.
