Huntingtin protein interactions altered by polyglutamine expansion as determined by quantitative proteomic analysis

Tamara Ratovitski,^{1,*} Ekaterine Chighladze,¹ Nicolas Arbez,¹ Tatiana Boronina,² Shelley Herbrich,³ Robert N. Cole² and Christopher A. Ross^{1,4,*}

Supplemental figures and tables legends

Figure S1. The IPA network diagram, including Htt, showing proteins related to DNA Metabolism, Energy Production, Neurological Disorder and Cell Cycle, based on the protein data set shown in Table S1 (CV<0.35 between duplicate samples). Proteins identified as 50Q preferential interactors are shown in red; 20Q preferential interactors are shown in green; proteins equally present in both 50Q and 20Q IPs are shown in yellow; Htt is shown in purple; proteins that were not detected by us, but fit into the network are shown in white.

Figure S2. Merged two top networks, defined by IPA as most significantly enriched in differential Htt interactors (based on the proteins shown in Table S1), includes proteins related to Gene Expression, RNA post transcriptional modifications and Protein Synthesis. Proteins identified as 50Q preferential interactors are shown in red; 20Q preferential interactors are shown in green; proteins that were not detected by us, but fit into the network are shown in white.

Table S1. Htt differential interactors. Proteins identified with median iTRAQ ratios >1.2 or <0.8 between Htt-50Q and Htt-20Q were considered as differential interactors. Only proteins with coefficient of variation (CV) less than 0.35 (calculated from iTRAQ ratios between 2 parallel biological replicates) are shown.

Table S2. Htt most significant differential interactors. Proteins most significantly changed in abundance between normal and expanded Htt complexes with ANOVA p-value less than 0.05 are shown

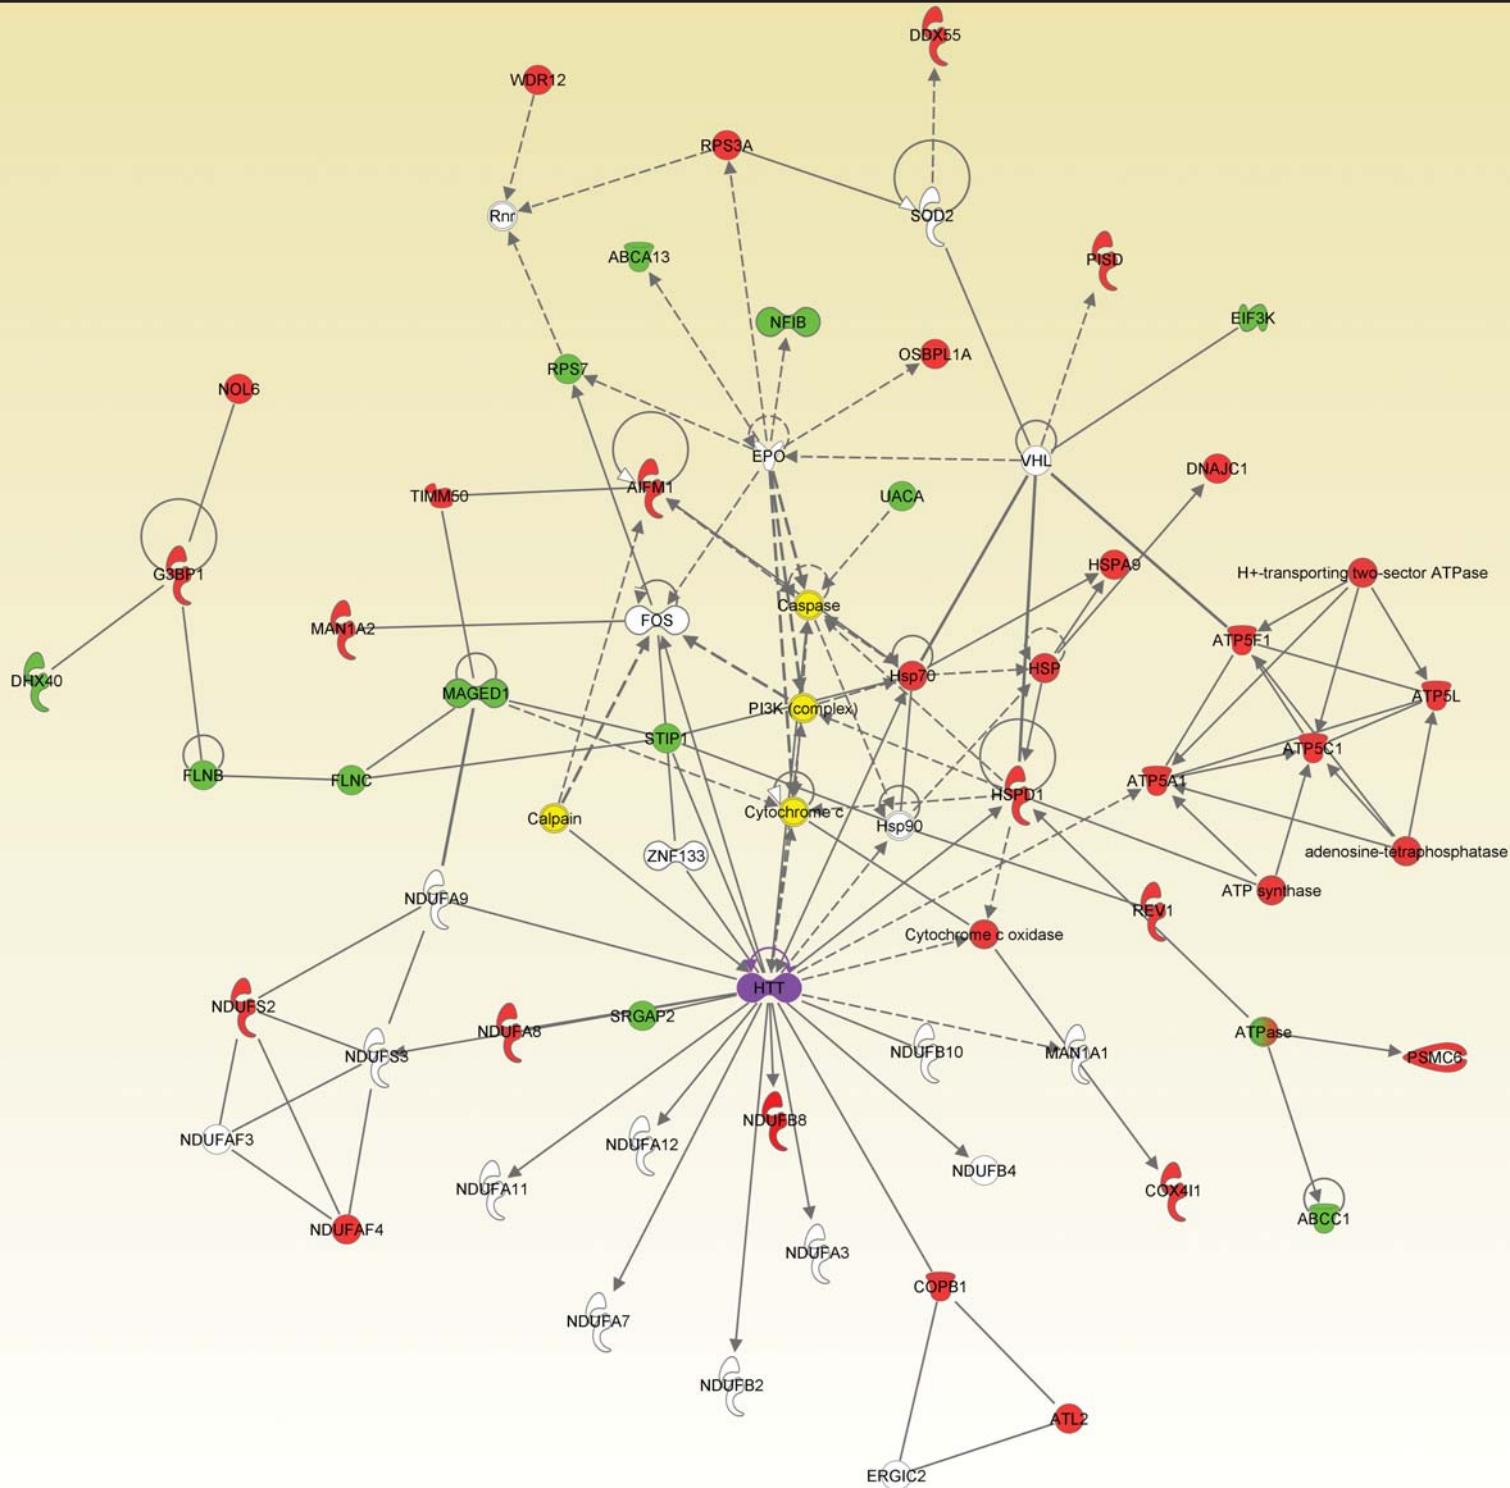

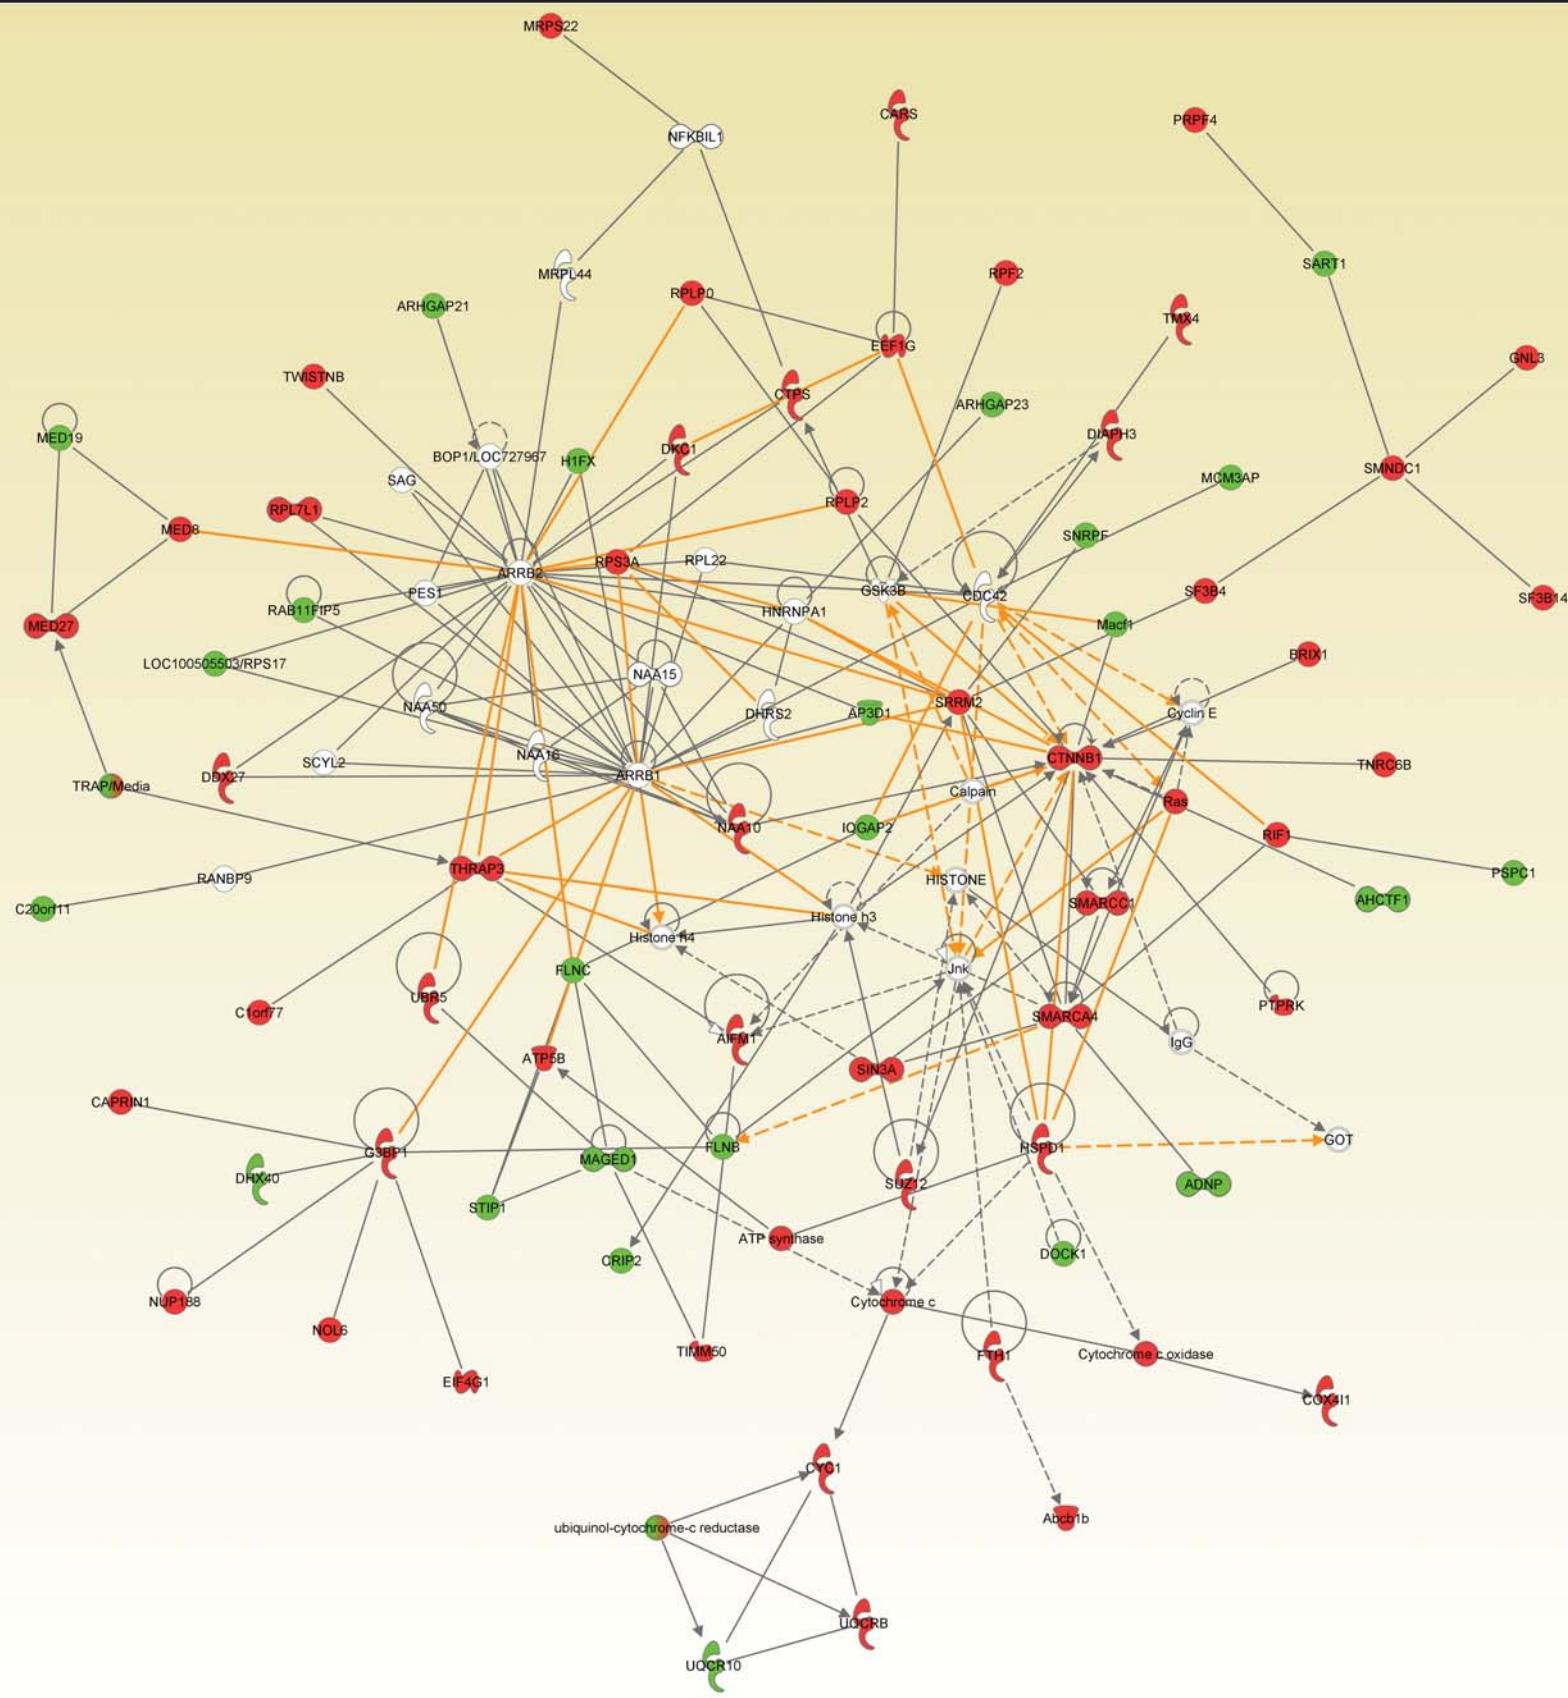

Figure S1
