Figure S1. Cdh1 can directly bind to E2F2 and E2F4.

A. GST, GST-E2F1 or GST-E2F2 was immobilized onto glutathione-Sepharose beads and incubated with 0.2 µg of Cdh1. Cdh1 bound to E2F1 or E2F2 was resolved by SDS-PAGE and detected by immunoblotting. The GST proteins were shown by Ponceau S staining.

B. GST, GST-E2F1 or GST-E2F4 was immobilized onto glutathione-Sepharose beads and then incubated with 2 µl of [S^{35}]-labeled Cdh1. The bound [S^{35}]-labeled Cdh1 was detected by Storm Phosphorimager. The membrane was also immunoblotted with a GST antibody to detect GST fusion proteins.
