

Supplemental Data

Supplemental Figure 2. shRNA lentiviral transduction particle to cav1 reduces caveolin-1 expression by >80% in cultured endothelial cells. Western blot analysis of BAEC infected for 24hrs with either caveolin-1 (shCav1) or a control (shCont) shRNA lentiviral transduction particle. Cells were treated with detergent to solubilize the proteins which were then detected using antibodies to either caveolin-1 or β -actin. The constant β -Actin signal confirms equal protein loads of each gel lane.
