

Supplementary Information, Figure S3 Shorter primary root phenotype of *bbx24* under UV-B radiation.

Wild type and *bbx24* were grown under various light conditions for 7 d (light/dark, 16/8 h, unless indicated otherwise). Data shown are mean (\pm SEM) of four independent replications. Statistically significant difference of *bbx24* relative to its wild type was indicated by a double asterisk ($P < 0.01$).
