

Supplementary Information, Figure S4 Comparison of the UV-B responses of the pBBX24::BBX24-GFP transgenic plant with its wild type (WT).

Hypocotyl lengths of 5-day-old WT and the transgenic plants under various UV-B radiation levels were shown. Data shown are mean (\pm SEM) of three independent replications. No significant difference between the hypocotyl length of WT and that of the transgenic lines were found (Student's *t* test).
