

Supplementary Information, Figure S7 Quantitative RT-PCR analysis of the expression of four UV-B-responsive genes in *bbx24* mutant and a BBX24-GFP overexpression line.

Plants were grown under white light for 5 days, and then transferred to supplementary UV-B radiation (0.6 W m^{-2}) for 10 h. All the data shown are means (\pm SEM) of three independent replications. Statistically significant differences of *bbx24* or 35S::BBX24-GFP relative to the wild type control are indicated by a double asterisk ($P < 0.01$) or a single asterisk ($P < 0.05$).
