^aThis forward oligonucleotide was combined with the GNAT domain reverse oligonucleotide. ^bChanges as defined in Fig. 2B.

Supplementary Figure S1. The structures of **(A)** the NAGS from *N. gonorrhoeae* (PDB file 2R8V) and **(B)** of NAGK from *P. aeruginosa* (PDB file 2BUF) to illustrate grossly their structural similarity. They are viewed along their threefold axes, with each dimer colored differently and both subunits of each dimer in different color hues. AAK and GNAT domains are shown, respectively, in cartoon and surface representation. In the case of NAGS, to avoid occluding the view of the AAK domains, the GNAT domains are semi-transparent, and those in the background are fainter.
