Table S2: Significantly changed (i.e., disease-associated) transcripts altered in two or more of the five muscle types. Red indicates positive fold changes in the transgenic tissues. Green symbols indicate genes down regulated in DIA but up regulated in the other muscle. Shaded cells are used to highlight genes in common across multiple different muscle type comparisons.

Table S3. $\alpha\text{Tm}_{\text{slow}}$ protein expression and percentage of rod containing fibers in nemaline muscles^a.

Muscle	$\alpha\text{Tm}_{\text{slow}}(\text{WT} + \text{Met9Arg})$ protein (% total Tm expression)	% Rod Containing Fibers
Diaphragm	$35.5 \pm 2.7^{\text{b}}$	47% ^b
EDL	$20.2 \pm 3.0^{\text{b}}$	38% ^b
Gastrocnemius	24.8 ± 4.4	3%
Plantaris	27.4 ± 2.8	10%
Tibialis Anterior	$25.9 \pm 6.6^{\text{b}}$	15% ^b

^aThe mean percentage of the total $\alpha\text{Tm}_{\text{slow}}$ protein [WT (wild type) + $\alpha\text{Tm}_{\text{slow}}(\text{Met9Arg})$] \pm SEM expressed in the muscles listed from at least 3 mice from HSA- $\alpha\text{Tm}_{\text{slow}}(\text{Met9Arg})$ line 4. The contribution of $\alpha\text{Tm}_{\text{slow}}(\text{Met9Arg})$ protein to total $\alpha\text{Tm}_{\text{slow}}$ protein in each muscle is estimated at $\geq 93\%$ based on fiber type composition in the various muscles. Of the muscles examined, diaphragm has the greatest number of slow fibers with 7% slow fibers (38). Statistical significance was determined by two-tailed t test assuming unequal variances.

^bValues reported previously (37). Protein gel analysis to determine $\alpha\text{Tm}_{\text{slow}}$ content was as described in (37). Percent rod containing fibers were determined as described in Corbett *et al.* (12).
