

## Supplemental Data

### Supplemental legends:

#### **Supplemental Figure 1: Treatment of Bcl-2 overexpressing cells with ABT-737 does not induce any significant changes in Bcl-2 family member expression.**

Western blot analysis of thymocytes from (A) *vavP-Bcl-2*, (B) WT or *vavP-Mcl-1* treated for 24 h with ABT-737 (200 nM) in the presence of the caspase inhibitor QVD-OPH (25  $\mu$ M) revealed no change in the expression of Bcl-2, Bcl-x<sub>L</sub>, Mcl-1 or Bim.

#### **Supplemental Figure 2: Bim binding partners.**

(A) High Bcl-2 levels increase Bim stability. Estimation of Bim and Bcl-2 stability in thymocytes treated with CHX (50  $\mu$ g/ml, Sigma) for the indicated times. The 8 h control sample shown with an asterisk was treated in the presence of the proteasome inhibitor MG-132 (20  $\mu$ M, Sigma). All cells were co-treated with the pan-caspase inhibitor QVD-OPH (25  $\mu$ M). (B) Higher expression of Mcl-1 correlates with higher Bim levels in *vavP-Mcl-1* lymphocytes. Expression of Mcl-1 and Bim in *vavP-Mcl-1/Bim<sup>+/+</sup>*, *vavP-Mcl-1/Bim<sup>B/B</sup>* and *vavP-Mcl-1/Bim<sup>N/N</sup>* thymocytes was determined by western blot. The level of the Bim<sup>B/B</sup> mutant (which does not bind to Mcl-1) was not significantly increased when Mcl-1 was overexpressed. (C) Thymocytes from *vavP-Bcl-2* mice were cultivated for 5 hr with cycloheximide (CHX) (50  $\mu$ g/mL), QVD-OPH (25  $\mu$ M) and ABT-737 (1  $\mu$ M) prior to Bim immunoprecipitation.

#### **Supplemental Figure 3: Overexpression of Bcl-x<sub>L</sub>, Bcl-w or Mcl-1 protects from ABT-737 induced cell death.**

(A) Overexpression of Bcl-2, Bcl-x<sub>L</sub>, Bcl-w or Mcl-1 caused resistance to etoposide or dexamethasone. Lymphoid cells were treated for 24 h with the indicated doses of these drugs. These results represent the means of 3 independent experiments, each of which was performed in triplicate,  $\pm$  SEM. (B) Heat-Map representing the EC50 for ABT-737 sensitivity of different subsets of B and T cells from mice reconstituted with WT fetal liver cells transduced with retroviral vectors having no insert or encoding Bcl-2, Bcl-x<sub>L</sub>, Bcl-w or Mcl-1.

#### **Supplemental Figure 4: Pro-survival proteins overexpressed in lymphoid cells are bound to Bim.**

(A) Lethally irradiated mice were reconstituted with fetal liver cells transduced with pMIG retroviral vectors having no insert or expressing FLAG-Bcl-2, FLAG-Bcl-x<sub>L</sub>, FLAG-Bcl-w or FLAG-Mcl-1. Spleen lysates were subjected to immunoprecipitation using anti-FLAG antibody and the level of Bim complexed to pro-survival proteins was assessed by western blotting. Duplicate results shown are from independent mice. (\*, non-specific band). (B) Half-life of the FLAG-tagged overexpressed pro-survival Bcl-2 family members and Bim was assessed by Western blot analysis following treatment of thymocytes with CHX (50 µg/mL) at the indicated times. The asterisked 8 h sample was also exposed to MG-132 (20 µM). All cells were co-treated with QVD-OPH (25 µM). Mcl-1 analysis is presented as a positive control. (C) Real-Time quantitative PCR experiments using Sybr Green were performed to determine the levels of mRNA transcripts. cDNA was prepared from thymocytes of mice reconstituted with WT fetal liver cells expressing the *Bcl-2*, *Bcl-x<sub>L</sub>*, *Bcl-w*, *Mcl-1* or control (Ctl) (empty) vector. The values have been normalized to actin levels and are means (± SEM) obtained from 5 mice per group.

**Supplemental Figure 5: ABT-737 is more efficient at displacing Bad/Bcl-x<sub>L</sub> complexes than BimΔC/Bcl-x<sub>L</sub> complexes.**

Confocal images of Flp-In<sup>TM</sup> T-REx<sup>TM</sup> 293 cells with single copy integration of an inducible bicistronic construct expressing eGFP-Bcl-x<sub>L</sub> with mCherry-Bad or mCherry-BimΔC at 0, 100, or 350 minutes after 11.1 µM ABT-737 addition. Scale bar represents 25 µm and applies to all panels.

**Supplemental Figure 6: Bcl-2 sensitizes lymphocytes to ABT-737 while Bcl-x<sub>L</sub> and Bcl-w protect them against it.**

ABT-737 disrupts Bcl-2/Bim complexes efficiently, freeing Bim, which can then inhibit Mcl-1. Bcl-x<sub>L</sub>/Bim complexes are resistant to disruption by ABT-737, leaving Mcl-1 free to inhibit Bax/Bak.

**Supplemental Table 1: EC<sub>50</sub> values presented as heat-maps in Figure 3A and 4E.**

Values represent the mean of the EC<sub>50</sub> collected from at least 3 independent experiments done in triplicate (except for *Bax<sup>-/-</sup>Bak<sup>-/-</sup>* DKO transgenic mice, 1 experiment done in triplicate could be done). Two sample t-tests have been done as described in Methods. P-values were adjusted for multiple testing within a cell type using Holm's method. In some cases, the sigmoid curves 'dose-responses' did not

converge and did not reach 50% viability below 4  $\mu$ M, therefore we assumed that the  $EC_{50} > 4 \mu$ M.

**Supplemental Table 2:  $EC_{50}$  values presented as heat-maps in Fig. 3B and Supplemental Figure 3A.**

As in **Supplemental Table 1**, values represent the mean of the  $EC_{50}$  collected from at least 3 independent experiments done in triplicate. Two sample t-tests were performed comparing each cell type from reconstituted mouse with WT + Empty vector.
