

## **Supporting Information**

### **1. Variation in % overcalcified of detached coccoliths**

Free coccoliths of *E. huxleyi* were counted in each sample. The free coccoliths were always more numerous than the coccospores, which allowed for larger sample sizes ( $> 300$  liths categorised) and therefore greater confidence in the percentage contribution of each morphotype to the total population. The trend identified (Supplementary Figure S1) is the same as found for the intact coccospores (Figure 2, main text).

### **2. Statistics**

In order to test for statistical significance of the summer-winter morphotype differences, summer and winter months were compared. For each month the data consisted of the % overcalcified values for all stations within the Bay of Biscay (44-46°N) where at least 5 cells were viewed. The three months December, February and March were chosen as representative of winter, the three months May, June and July as representative of summer:

December = {100, 82, 100, 88, 91, 91, 78}

February = {100, 96, 96, 97, 98, 98, 92}

March = {71, 74, 86, 88, 75, 94, 97}

May = {20, 5, 0, 31, 0, 0, 0}

June = {9, 0, 0, 0, 0, 0}

July = {0, 0, 0, 0, 0}

A one-tailed Student's t-test was used to test the null hypothesis that there was a similar or greater proportion of overcalcified morphotypes in the summer than in the winter. Each of the summer months was separately compared to each of the three winter months, leading to  $3 \times 3 = 9$  tests in total. In each case the t-test clearly shows the null hypothesis to be falsified. There is a significantly greater proportion of overcalcified cells in each winter month than in each summer month ( $p \ll 0.001$ ).

## Supporting Figure S1

**Figure S1.** Variation in morphotype dominance of detached coccoliths by month. Counts are summed over all stations for the deep water in the Bay of Biscay ( $44^{\circ}$ - $46^{\circ}$ N). Once 300 coccoliths of either morphotype had been counted in a set of images, no further counting was conducted for that morphotype, but counting of the other morphotype was continued. This led to a maximum estimate for the % overcalcified in September (% is no higher than the value shown), and a minimum estimate in February (% is at least as high as the value shown), as indicated by the arrows on the plot.
