Submitted August 11, 1988

Accession no. X12461

We present the nucleotide sequence of a 1.8 kb cDNA clone (p6A) isolated from chicken muscle cDNA library, in λ gt10, using a fragment of the viral *yes* DNA (1,2) as a probe. The longest open reading frame encodes a protein product with canonical features of a tyrosine-protein kinase (3) and with 99% homology to the viral *yes* protein. What could be inferred about the protein from the deduced amino acid sequence (size, activity, myristylation site) confirms what is known about the chicken cellular *yes* protein, pp62^{-*yes*} (2,4). The chicken cellular and viral *yes* gene products differ by 6 amino acids substitutions and carboxy-terminal peptides.
