

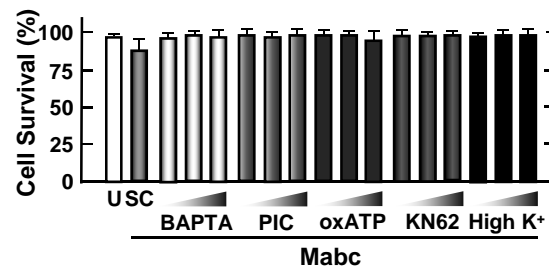

## Figure 1 review purpose only

**Fig. 1. for Review. Cell viability is not inhibited by various inhibitors/reagents in this study.** Human MDMs were pretreated with BAPTA-AM (BAPTA; 5, 10, or 25  $\mu$ M), picetannol (PIC; 5, 10, or 20  $\mu$ g/mL), oxATP (100, 200, and 300  $\mu$ M), KN62 (0.1, 1, and 10  $\mu$ M), or high K<sup>+</sup> buffer (10, 50, and 150 mM) for 45 min prior to Mabc (moi = 3) infection. After various pre-treatments, cells were cultured for 24 h, followed by Trypan blue exclusion assay.
