

Figure S6

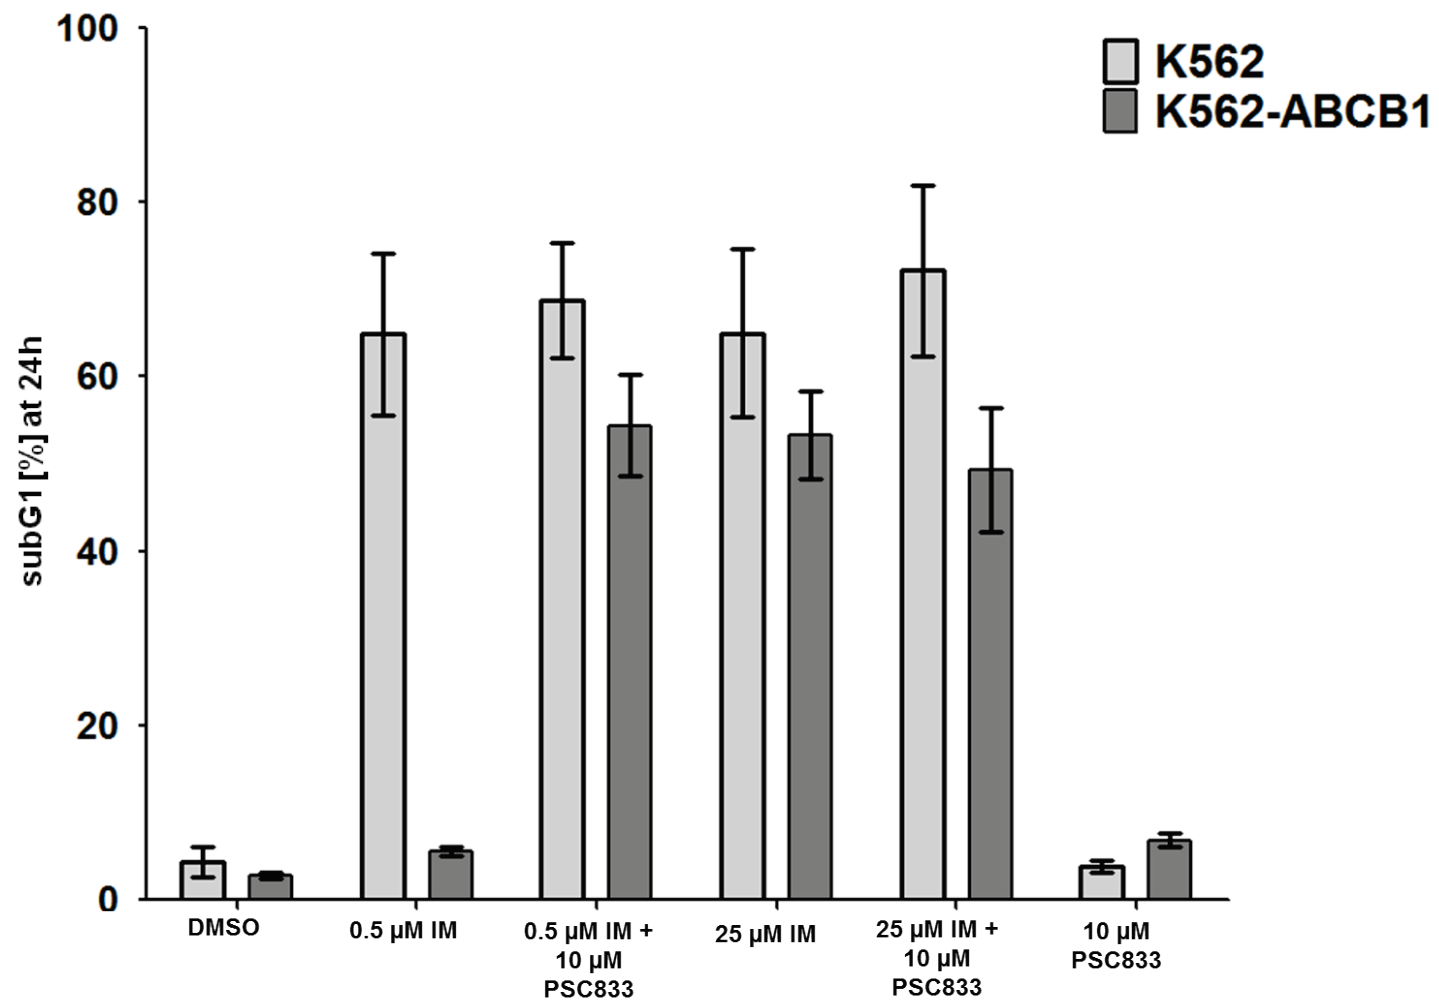

Figure S6: ABCB1 expression confers imatinib resistance in K562 cells

K562 and K562-ABCB1 cells were treated continuously either with 0.5 μ M or 25 μ M imatinib in the presence or absence of 10 μ M PSC833 as indicated. Cells exposed to 0.35% DMSO or 10 μ M PSC833 alone served as a control. Samples were analyzed after 24h by flow cytometry after propidium iodide staining. Three independent experiments were performed and results are shown as means \pm SEM.
