

Supplemental Figure 1. Identification of activation-tagged genes in *ATG791*.

A. *ATG791* contains two T-DNA inserts (designated “I” and “II”, not drawn to scale) separated by ~3.3 Mb. These inserts are 1122 bp and 354 bp upstream from the predicted translation initiation codons of *At5g55180* and *At5g64210*, respectively. Arrowed boxes represent genes and direction of transcription; “>” indicate P35S enhancer sequences adjacent to the right T-DNA border (RB).

B. RNA gel blot analysis of total cell RNAs from wild type, *im* and *ATG791* seedlings. Equal amounts of RNA (1 µg) from four week-old rosette leaves were electrophoresed through formaldehyde gels and transferred to nylon filters; the filters were probed with ³²P-labeled gene-specific PCR products (primers are listed in Supplemental Table 1) from genes that surround inserts I (*At5g55150*, *At5g55160*, *At5g55170*, *At5g55180* & *At5g55190*) and II (*At5g64200*, *At5g64210* & *At5g64220*). Transcripts from *At5g55150* could not be detected in any of the lines.

Supplemental Table 1. Primers used in this study
