
Restriction enzymes and their isoschizomers

Richard J.Roberts

Cold Spring Harbor Laboratory, Cold Spring Harbor, NY 11724, USA

INTRODUCTION

Since the last compilation of restriction enzymes (1), 156 new entries have been added including 12 new specificities. With the growing size of this database and the recognition that the most widespread use of the information is as a database for computer programs predicting restriction enzyme cleavage patterns, the new format has been continued. This format is intended to contain the minimal amount of information required by a computer program. It should be noted that only enzymes for which the recognition sequence is known are included. This new list is shown in the first Table, while an alphabetical listing of all Type II enzymes is presented in the second Table. A copy of the restriction enzyme data base in its previous format (2), including enzymes of unknown recognition sequence, will be available upon request. It should also be noted that an alternative compilation of these enzymes has recently been produced (3).

The database shown in these Tables is available online through the BIONET computer resource. A version corresponding to the printed text is located in the file <ROBERTS>RESTRICT.NAR. Several alternative versions are available and are documented in <ROBERTS>RESTRICT.DOC.

In forming this list, all endonucleases cleaving DNA at a specific sequence have been considered to be restriction enzymes, although in most cases there is no direct genetic evidence for the presence of a restriction-modification system. The endonucleases are named in accordance with the proposal of Smith and Nathans (4).

Several enzymes appear in this list with revised names. These revisions were made to avoid confusion with existing enzymes or to increase the uniformity of the names. In each case the name changes were made with the approval of the appropriate authors. The specific changes are as follows. *EagKI* replaces *EagI* (5) and *AniMI* replaces *AniI* (130), since the latter names had been used for other enzymes. *NspI-V* replaces *Nsp(7524)I-V* (6). This had already been used in many publications and catalogs. *CviQI* replaces *CviII* (7) to show that this enzyme comes from a strain different from that encoding *CviI*.

FOOTNOTES

- * signifies that *DpnI* and its isoschizomers require the presence of 6-methyladenosine within the recognition sequence GATC.
- Recognition sequences are given using the standard abbreviations (475) to represent ambiguity:

R = G or A
 Y = C or T
 M = A or C
 K = G or T
 S = G or C
 W = A or T
 H = A or C or T
 B = G or T or C
 V = G or C or A
 D = G or A or T
 N = A or C or G or T

3. The site of methylation by the cognate methylase when known is indicated as follows. The first number shows the base within the recognition sequence that is modified. A negative number indicates the complementary strand. The number in parentheses indicates the specific methylation involved. (6) = N6-methyladenosine (5) = 5-methylcytosine (4) = N4-methylcytosine.
4. Commercial sources of restriction enzymes are abbreviated as follows:
 - A Amersham (4/87)
 - B Bethesda Research Laboratories (9/87)
 - G Anglian Biotechnology Ltd. (1/88)
 - I International Biotechnologies Inc (7/87)
 - M Boehringer-Mannheim (3/88)
 - N New England Biolabs (3/88)
 - P Pharmacia P-L Biochemicals (3/88)
 - R Promega Biotec (9/87)
 - U United States Biochemical Corporation (2/88)
5. *EcoRII* isoschizomers fall into two classes based upon their sensitivity to methylation. *EcoRII* will not cleave when the second cytosine in the recognition sequence is methylated to 5-methylcytosine whereas *MvaI* will cleave such a sequence. Isoschizomers of *EcoRII* that are like *MvaI* are indicated by +.
6. *MboI* isoschizomers fall into two classes based upon their sensitivity to methylation. *MboI* will not cleave when the recognition sequence contains 6-methyladenosine whereas *Sau3AI* will not cleave when its recognition sequence contains 5-methylcytosine. Isoschizomers of *MboI* that are like *Sau3AI* are indicated by +.
7. *TaqI* differs from other restriction enzymes in recognizing two distinct sequences: GACCGA(11/9) and CACCCA(11/9).
