

Supplemental Figure 1 The number of nuclei in multinuclear osteoclasts overexpressing trCot

(A) The number of nuclei in individual multinuclear osteoclasts. The horizontal lines of varying length at the dots indicate the number of cells. n= 70. (B) The average number of nuclei in multinuclear osteoclasts infected with GFP (control) or trCot-expressing virus. Shown are means \pm SEM. n=70. **P < 0.01. N.S., difference not significant.
