Suppl. Fig. 1

Supplementary Figure 1. Administration of FTY720 to non-infected (control) mice. (A) Percentage of leukocyte populations in the blood of non-infected vehicle-treated and FTY720-treated animals on day 14. Leukocytes were isolated from the blood of non-infected animals on day 14 and stained with flurochrome-labelled mAb. They were analyzed by flow cytometry in which 10,000-20,000 events were recorded. Data represents the mean percentage of CD3 (T cells), CD11c (DCs), B220 (B cells), and Ly6G (neutrophils) positive cells. (B) Colon weight (3 cm distal) in vehicle-treated and FTY720-treated non-infected mice. Data represents the mean of 4 individual mice \pm SEM. Significance determined by unpaired student's T test, ***P < 0.001, **P < 0.01,*P < 0.05.
