Legend for Supplementary Table 1:

Mean log fold-induction (+/- standard deviation) in gene expression of 18 cytokines and chemokines after 24 hrs restimulation of PBMC with heat-killed H37Rv *Mycobacterium tuberculosis* are shown for placebo and prednisone-treated patients at weeks 0, 2 and 4 on the clinical trial. P-values were calculated for comparisons between 0 and 2 weeks values and 0 and 4 week values for each treatment group separately using Student's paired t-tests. Two patients in the placebo-treated arm switched to open label prednisone at week 2 and their week 4 samples were thus excluded from analysis.

Significant differences are indicated with *. After Bonferroni correction for multiple comparisons ($p_{corr} = p \times 18 - 1 = p \times 17$) only the change in IL-4 in prednisone-treated patients between week 0 and 4 remained significant ($p_{corr} = 0.03$).

Supplementary Table 2: Changes in concentrations of cytokines and chemokines in supernatants of cell cultures after restimulation of PBMC with heat-killed H37Rv *Mycobacterium tuberculosis* for 24 hrs assessed by Luminex multiplex assay

Legend for Supplementary Table 2:

Results shown are cytokine/chemokine concentrations assayed with Luminex multiplex subtracting concentration in unstimulated PBMC cultures from concentration in cultures of PBMC stimulated with heat-killed H37Rv for 24 hrs. Median and interquartile range values are presented and units are pg/ml. The exception was IL-8 which was assayed using ELISA and units are in ng/ml. P-values were calculated for comparisons between 0 and 2 weeks values and 0 and 4 week values for each treatment group separately using Wilcoxon matched pairs test. Two patients in the placebo-treated arm switched to open label prednisone at week 2 and thus their week 4 sample was excluded from analysis.

Significant differences are indicated with *. After Bonferroni correction for multiple comparisons ($p_{corr} = p \times 17-1 = p \times 16$) none of the differences remained significant.

Supplementary Table 3: RT-PCR experiments showing delta Ct (Ct gene of interest – Ct β -actin) values of unstimulated samples after 24-hour cell culture. Statistical comparisons were made between week 0 and 2 and between week 0 and 4 values for placebo- and prednisone-treated participants separately.

Legend for Supplementary Table 3:

Values shown are median (IQR) of delta Ct values.

The paired Wilcoxon signed-rank test was used to compare medians.

Supplementary Table 4: Serum Luminex multiplex assay comparing the change (or delta) in concentrations of cytokines/chemokines between week 0 and week 2 for those participants who had symptom improvement over this period to those who had no improvement or deteriorated.

Cytokine/chemokine	Non-improvers (n= 20)	Improvers (n=35)	p-value
