

Figure S1. Effect of doxycycline treatment alone on ricin-dependent depurination in parental HEK293T cells. HEK293T cells were pre-treated with or without doxycycline (0.1 $\mu\text{g}/\text{ml}$ for 96 h), followed by treatment with 0.4 nM ricin for 60 minutes. Data indicate the fold change in depurination relative to untreated (no toxin) cells and represent the mean \pm SD of triplicate reactions from two independent experiments. N.S. (not significant) indicates $P > 0.05$, as analyzed by a student's paired, two-tailed t test.
