Table S5. T7 ODEs Parameter updates, values, and references.

Parameter	Explanation of Change	Value	Units	Reference
$k_{T7,transloc}$	Phage T7 translocation rate. All rates were measured at 37C. Second and third rates are determined by E. coli and T7 RNA polymerase transcription rates respectively (see below).	[141 , 55 , 400]	bp/sec	[1-3]
$k_{Ec,RNAP}$	E. coli RNA polymerase transcription rate. Measured at 37C.	55	nt/sec/RNAP	[2]
$k_{T7,RNAP}$	T7 RNA polymerase transcription rate. Measured at 37C to be 2x faster than 200 nt/s/RNAP found at 30C.	400	nt/sec/RNAP	[3]
$k_{d,T7mRNA}$	T7 mRNA decay rate. Functional decay of early T7 mRNA found to be 6.5min at 30C, converted to rate, conservatively not adjusted for temperature since data is for early transcripts.	0.001	/sec	[4]
k_{RIBO}	Specific translation rate or ribosomes. Measured at 37C.	42	nt/sec/ribo	[5]
$k_{d,pro}$	T7 Protein Decay Rate. Adjusted from 2.8E-5 /sec at 30C to 37C using Arrhenius approximation.	3.92×10^{-5}	/sec	[6]
C_{repDNA}	T7 DNA Replication critical threshold of gp1 binding by gp3.5. Stated as arbitrarily set in T7v2.5 code.	5×10^{-7}	M	-
$k_{T7,DNAP}$	T7 DNA Replication rate. Found to be over 300 bp/sec/polymerase at 37C using techniques in Tabor et al. 1987.	475	$\frac{bp}{sec \cdot polymerase}$	[7]
$K_{M,DNA}$	DNA polymerase Km. Measured at 37C.	8668	nt/cell	[8]
$k_{T7,pack}$	T7 DNA Packaging rate. Adjusted from 0.702 /min at 30C to 37C using Arrhenius approximation.	0.983	/min	[9]
$C_{nuc,PC}$	Procapsid nucleation concentration. Changed to avoid numerical solver error, to single multiple of procapsid stoichiometry (see below). Original value used was for phage P22, understanding of T7 assembly mechanism recently updated.	431	$\frac{molecules}{cell}$	[10,11]

Parameter	Explanation of Change	Value	Units	Reference
$k_{d,EcDNA}$	Host genome degradation rate. As per original T7 ODEs, assuming rate consistent with 7.5 to 15 min degradation, 0.85 of host genomic material degraded, and n_{HG} the equivalent number of host genomes from correlation. Factor results from $\frac{(4.655 \times 10^6 \text{ bp}) \frac{2nt}{bp}}{7.5 \text{ min} \frac{60s}{min}} 0.85$	$n_{HG} (1.76 \times 10^4)$	$\frac{nt}{s}$	[12]
$t_{d,EcDNA}$	Host genome degradation period. Original limits 7.5 to 15 min measured for 37C, allowed to continue past 15 min if degradation limited by metabolic interaction.	> 7.5	min	[12]
