

Supplemental Material

Supplemental Table.

**Spearman Correlation coefficients between Cystatin C and other measures of GFR
in patients with “preserved” and “impaired” renal function.**

	CORRELATIONS		
	Total Cohort n=823	eGFR \geq 60ml/min/1.73m ² n=615	eGFR<60ml/min/1.73m ² n=208
Urea	0.70	0.49	0.64
Creatinine	0.73	0.50	0.68
eGFR_{MDRD}	-0.79	-0.60	-0.76
eGFR_{CysC}	-0.98	-0.97	-0.99
eGFR_{sCr+CysC}	-0.93	-0.88	-0.94

Supplemental Figure.

**Incidence of Death, Myocardial Infarction, or Stroke according to quartiles of
Different Renal Function Measures in the Preserved Renal Function Subgroup
($eGFR_{MDRD} \geq 60 \text{ ml/min}/1.73\text{m}^2$).**

1st quartile encompasses lowest values of creatinine, urea, cystatin C, $eGFR_{MDRD}$ and $eGFR_{CysC}$. P-values for trend according to Cochran-Armitage.
