

ESM Fig. 2 ORs for diabetes prevalence across the 12 individual urbanisation components, by sex^{a,b}

^aResults of 12 sex-stratified multilevel logistic regression models per sex, with individual-level age and household income as fixed effects and with the community and province of residence as random effects

^bORs for diabetes prevalence presented for the 75th (high) relative to the 25th (low) percentile of each of the 12 urbanisation index components
