

Figure S6. Biomass accumulation is affected in *P35S:Nf-YA* and *P35S:miR169nm* lines.

Total biomass of twelve-day-old seedlings was determined and used to calculate the relative biomass to the WT (expressed as a percent of the value for WT line growing on control medium, set to 100 %). Values are means and SD of three biological replicates statistically treated using a student *t*-test (* $P < 0.05$).
