

Figure S12. *NF-YA* overexpression delays dark-induced senescence.

Images of four-week-old wild type (WT), *P35S:NF-YA* and *P35S:miR169nm* plants before (T0) and 7 days after dark treatment (T7). The left column shows the phenotypes of whole plants at the beginning of the assay (T0); the middle column of the plants subjected to the treatment (T7) and the right column the rosette leaves of T7 plants. Bars = 10 mm, on the left and middle panels, and 5 mm on the right panels.
