

Figure S15. Dose-dependent effect of estradiol on seedling phenotype of homozygote and heterozygote *PXVE:NF-YA2SRDX* transgenic plants.

Eight-day-old transgenic and WT seedlings grown on media supplemented with different concentrations of estradiol ranging from 20 nM to 20 μ M belonging to two independent segregating (ht, heterozygote; hm, homozygote) transgenic lines (line numbers are given above the photograph) were analyzed. **(A)** 20 nM; **(B)** 200 nM; **(C)** 2 μ M; **(D)** 20 μ M.
